Background. The University of Zimbabwe College of Health Sciences (UZCHS), Harare, which has a long tradition of community-based education (CBE), has not been evaluated since 1991. An innovative approach was used to evaluate the programme during 2015.

Objectives. To evaluate the CBE programme, using a peer-review model of evaluation and simultaneously introducing and orientating participating colleagues from other medical schools in southern Africa to this review process.

Methods. An international team of medical educators, convened through the Medical Education Partnership Initiative, worked collaboratively to modify an existing peer-review assessment method. Data collection took the form of pre-visit surveys, on-site and field-visit interviews with key informants, a review of supporting documentation and a post-review visit.

Results. All 5 years of the medical education curriculum at UZCHS included some form of CBE that ranged from community exposure in the 1st year to district hospital-based clinical rotations during the clinical years. Several strengths, including the diversity of community-based activities and the availability of a large teaching platform, were identified. However, despite the expression of satisfaction with the programme, the majority of students indicated that they do not plan to work in rural areas in Zimbabwe. Several key recommendations were offered, central to which was strengthening the academic co-ordination of the programme and curriculum renewal in the context of the overall MB ChB curriculum.

Conclusion. This evaluation demonstrated the value of peer review to bring a multidimensional, objective assessment to a CBE programme.

Afr J Health Professions Educ 2017;9(3):138-143. DOI:10.7196/AJHPE.2017.v9i3.733

The Medical Education Partnership Initiative (MEPI) was a large-scale, US government investment in strengthening the health workforce in Africa by providing medical schools with funding to implement activities based on local needs and priorities. Schools that were awarded the grant chose to invest in strengthening community-based education (CBE) and formed a technical working group convened by the Coordinating Centre of MEPI (a partnership of institutions also funded by the MEPI grant). The technical working group collaborated with CapacityPlus (a US Agency for International Development (USAID)-supported programme with funding specifically allocated to work with the MEPI schools) to strengthen their CBE programmes.^[1] Within this context, the University of Zimbabwe College of Health Sciences (UZCHS) requested a peer review of its CBE programme. The evaluation served as a learning exercise for both UZCHS and other medical schools in the MEPI network in applying the peer-review process while evaluating the UZCHS CBE programme.

CBE is increasingly included as part of health sciences curricula across the globe. It forms part of an educational strategy to address the worldwide inequities in human resources for health by preparing graduates for service to rural and under-served populations.^[2] The protocol developed by the Collaboration for Health Equity through Education and Research (CHEER) was adapted for use by UZCHS to evaluate its CBE programme. CHEER was formed in South Africa (SA) during 2003 to examine strategies that would increase the likelihood of health professional graduates choosing to practise in rural and under-served areas.^[3,4] Since then, the CHEER model has demonstrated effectiveness in examining complex outcomes in medical education in countries other than SA, as reported by S Reid on the University of Cape Town's Primary Health Care Directorate website (www.primaryhealthcare.uct.ac.za/).

The medical school in Harare, Zimbabwe was established in 1963 and runs a 5-year undergraduate medical programme (MB ChB). The uni-

versity's intention to expose students to CBE originated with the idea of a 'village family scheme', whereby students were attached to families in rural areas.^[5] The evaluated format of the CBE programme was formally launched in 1987. At the time of the peer review, 22 academic departments and 67 clinical teaching sites contributed to the implementation of the programme.

Objective

The aim of the review was to train colleagues from the network of MEPI schools in using the CHEER approach (Fig. 1) and to conduct an evaluation of how the medical school's CBE programme served to encourage future rural practice. The specific objectives were: (i) to identify gaps between theory and practice in education and training; (ii) to provide a report for ongoing curricular review; and (iii) to share best practices regarding preparation of students for practice in rural and under-served areas.

Methods

A descriptive study design, using mainly qualitative methods that focused primarily on semi-structured interviews and review of supporting documentation, was employed. In addition, a pre-visit questionnaire was distributed to faculty and students for completion from September to December 2014 to serve as baseline data prior to the review visit. All respondents for pre-visit questionnaires were identified by representatives of UZCHS using convenience sampling, whereby as many students and appropriate staff as were available were invited to complete the forms. Purposive sampling was done for the on-site face-to-face interviews in February 2015 through the identification of appropriate key faculty members and students, as well as graduates and clinical preceptors at two district hospitals. During the visit, an initial presentation of the findings and recommendations was made to the faculty to corroborate and supplement the findings. A follow-up visit to present final key findings and recommendations was conducted during May 2015; this meeting was also used to further validate the findings prior to drafting a final written report.

Two facilitators from SA (IC and DM), who were experienced in the CHEER peer-review approach, led a team of representatives from the medical schools in Botswana, Zambia and Malawi, who served as peer reviewers while being orientated to the evaluation process. Representatives of UZCHS were involved in the process, which commenced ~7 months prior to the visit and involved protocol adaptation and questionnaire distribution.

During the visit in February 2015, the reviewers divided into two sub-teams and conducted interviews of ~1 hour. Written notes were taken during the interviews, which were conducted with individual faculty members or pairs from the same department. Written, informed consent was obtained from each interviewee prior to commencement of the interview.

Students presented in two large groups of ~50 students each. Each group was seen separately but in parallel. Due to the large numbers of students, a paper response method was used to encourage response, whereby each student was handed a slip of paper on which to write their answer. Following each response, the paper was handed in and a brief discussion ensued to identify common issues.

Analysis

Analysis of pre-visit staff questionnaires was done using a grid to summarise answers to the questions as a result of a paucity of responses. The responses to the pre-visit student questionnaires were captured at UZCHS using the REDCap (USA) database. The descriptive analysis was conducted by members of the peer-review team in SA, with online access to the database. Thematic analysis was conducted on the qualitative aspects of the survey.

Fig. 1. The Collaboration for Health Equity through Education and Research (CHEER) peer-review process at the University of Zimbabwe College of Health Sciences. (CBE = community-based education; HODs = heads of department.)

All data from on-site interviews were analysed using recursive abstraction and summarised along broad themes outlined in the interview schedule based on the CHEER evaluation framework (Table 1), including the nature of involvement of each department in CBE (Table 2). The results were discussed by the review team, with consensus being reached on themes within and across the interviews. The students' paper responses to the structured questions were analysed using a thematic approach.

Research ethical approval was granted by the Medical Research Council of Zimbabwe (MRCZ) on 9 June 2014 (ref. no. MRCZ/A/1841).

Results

The CBE programme at UZCHS was found to be constrained by a number of remote and recent pressures, including the financial crisis in Zimbabwe, increasing staff shortages, increased student numbers, and deteriorating infrastructure. Despite these pressures, which had evolved over time, the programme had expanded from 10 purpose-built sites in eight provinces to more than 60 sites across all provinces, with positive relationships between the university, the Ministry of Health and Child Care, mission hospitals and private medical care providers in the mining industry.

Pre-visit survey results

The pre-visit surveys conducted from November to December 2014 resulted in a low response rate, with 5% ($n=54/1\ 164$) and 26% ($n=5/19$) of students and faculty responding, respectively. Key findings from the student survey were as follows: the majority (94%) did not plan to practise in rural or under-served areas upon graduation; community health workers were perceived as the most significant 'teachers' not employed by the university; and half of the respondents were in contact with graduates. The low response from faculty resulted in inadequate baseline data being available to reviewers. Faculty respondents were mainly involved with the clinical years (years 3 - 5), and none reported being involved in the CBE programme. All indicated that there was no policy that specified student recruitment from rural or under-served areas.

Table 1. Adapted CHEER evaluation framework

Criterion number	Evaluation criteria	Score		
		Less than expected	Adequate	Better than expected
1	Faculty mission statement	R/U not mentioned*	Some mention or indirect reference	Explicitly supportive
		Stated: 'Community-orientated and community-driven training and learning' [†] Issue of social accountability – where graduates go not addressed [†]		
2	Resource allocation	None [†]	Some staff and funding, but not enough*	Sufficient staff and funding for sustainability
		Biggest constraint. Worked well with external funding. The financial crisis had a major negative effect [†]		
3	Student selection	No policy with regard to R/U*	Some policy with regard to R/U	>25% rural origin
		None [†] Reported that most students come from lower SES backgrounds [†]		
4	First exposure	Final year, if at all	Middle years	1st year*
		Behavioural sciences convene 1st-year exposure [†] Exposure in every subsequent year [†]		
5	Length of exposure	None [†]	<5%*	>25% of practical in R/U areas
		4 - 8 weeks/year (1 - 5 days/week for the duration of attachment) [†]		
6	Practical experience	None [†]	Students watch and listen to others	Students hands-on and contributing*
		Develops over the years; 5th year very hands-on [†]		
7	Theoretical input	None [†]	R/U mentioned*	Critical reflection on R/U issues
		Mainly in community medicine; some reference in other disciplines [†]		
8	Involvement with community	Tourism-type exposure*	Engagement or intervention	Ongoing joint reflection
		Learn from the community, but don't contribute to it; unlike the rehabilitation sciences students [†]		
9	Relationship with health service	Students are a drain/burden	Students are tolerated	Students' input is welcomed and used*
		Very positive (especially senior years) [†]		
10	Assessment of students	No formal assessment for rural learning	Assessment was done, but not pass/fail*	Pass/fail contribution from rural component
		Reports and presentations compulsory, but no rigorous assessment of knowledge and skills acquired during CBE [†]		
11	Research and programme evaluation	No programme evaluation or reflection*	Evaluation is done, but not specific to R/U	Current educational research with regard to R/U
		None [†]		
12	Programme oversight and co-ordination	No academic co-ordination; administrative co-ordination only*	Some academic oversight at departmental level; some academic co-ordination	Good co-ordination with senior-level support and academic oversight
		There was good administrative co-ordination from the dean's office [†]		

CHEER = Collaboration for Health Equity through Education and Research; R/U = rural/under-served; SES = socioeconomic status.

*Reviewers' score.

[†]Reviewers' explanatory comments for choosing the score.

Review visit results

Face-to-face interviews were conducted with the dean, 23 faculty members in preclinical and clinical departments, four recent graduates and two off-site clinical preceptors. Modified group interviews were conducted with 3rd-year ($n=69$) and 4th-year ($n=52$) students. Several strengths and challenges were identified using the CHEER evaluation framework, as illustrated in Table 1.

The faculty mission statement does not overtly mention rural and under-served populations, but states that the institution strives for 'community oriented and community driven training and learning.' The

length of exposure to field attachments was estimated to be ~5% per year on average, with time spent ranging between 1 and 5 days per week for 4 - 8 weeks within one study year (Table 2). The community medicine curriculum provides theoretical input regarding healthcare in rural or under-served areas. Staff who supervise the preclinical and clinical field attachments are mostly non-clinicians and often work under difficult circumstances; yet, the programme boasts a large teaching platform (in excess of 67 sites across all provinces and districts in Zimbabwe), providing various exposure options.

Table 2. Summary of student exposure to community-based education

Year	Site	Duration	Department	Focus
1	Epworth (peri-urban)	Fridays: 2 × 8 weeks	Behavioural sciences (psychiatry)	Health-seeking behaviour; family health study
2	Communities around district sites: variable numbers	4-week block	Community medicine focus; all departments involved	Community characteristics, needs and structure
3	District hospitals in various towns	4-week block	'Field attachment office' (deanery); all departments involved	The health system; clinical skills (ward rounds, patient clerking)
4	Urban clinics	4-week practicum	Community medicine	Maternal and child health focus; general primary care medicine
5	District hospitals in various towns	4-week block	'Field attachment office' (deanery); all clinical departments involved	Core clinical disciplines; audit (ward rounds, patient clerking and ongoing patient management)

Table 3. Key recommendations

Key recommendations (presented)	Key recommendations (adopted)
Identify academic co-ordinator for CBE	Identify academic management structure for CBE Monitoring and evaluation
Revise CBE programme based on review results	Revise field attachment programme* to evolve into CBE based on results of review
Integrate CBE programme across medical departments	Integrate the MB ChB CBE programme across all teaching departments
Align learning objectives with the overall medical curriculum	Align CBE learning objectives with the overall medical curriculum
Launch a parallel medical curriculum revision process	
Align teaching platform to learning outcomes	Align teaching platform to learning outcomes
Increase CBE exposure time across the years	Increase CBE exposure time across the years
Improve student supervision	Improve student supervision
Attend to student accommodation, transport, maintenance and resources issues	Attend to student accommodation, transport, maintenance and resources issues

CBE = community-based education.

*University of Zimbabwe College of Health Sciences referred to existing CBE activities as the field attachment programme.

Note: The column on the left indicates recommendations made by the peer-review team, while the column on the right indicates the consensus reached by the university representatives, including the dean.

Table 4. Post-review visit: Key outcomes

- The establishment of a working committee for CBE revision. The first meeting of the committee was planned for 2 weeks from the date of the post-review meeting. The dean called the meeting and confirmed the convenor of the committee.
- The appointment of a convenor of this working group, who was nominated by the dean (the head of the HPE Unit).
- The inclusion of CBE in the staff development programme originally planned to focus on MB ChB curriculum planning.
- The agreement that the CBE curriculum review would take place in the context of the overall MB ChB curriculum revision.
- The agreement that student supervision will be revised and improved to include an academic component. The HPE Unit will develop an orientation programme for all supervisors to support the strengthening of CBE. This orientation will include a revision of the guidelines for supervision as per the new goals set for competencies that students should achieve during the field attachment.
- The agreement that HEALZ graduates from UZCHS would be co-opted to assist the HPE Unit and the CBE curriculum committee with the curriculum revision of the CBE programme.
- It was agreed that UZCHS will explore the implementation of innovative funding strategies for the CBE programme.

CBE = community-based education; HPE = health professions education; UZCH = University of Zimbabwe College of Health Sciences; HEALZ = Health Education and Advanced Leadership for Zimbabwe.

Accommodation at two field sites was upgraded in 2014/2015 and internet facilities were expanded, including a repository for textbooks and assignments.

Students value and enjoy the CBE experience, despite the poor living conditions at some sites due to lack of adequate maintenance, oversight and funding. They reported that the experiences impacted positively on their personal growth, empathic skills and professionalism.

Challenges

A number of limitations and challenges emerged. The institutional oversight and investment was limited, evidenced by the last MB ChB curriculum having been reviewed in the 1980s and the last substantial amendments to the field attachment programme made in the 1990s. The relationship between the medical school and the community leans towards a 'tourism-type' exposure, with no evidence of a partnership with the community, especially during the non-clinical years.

The dean has provided high-level support and visibility for the programme and administrative oversight for the 2nd-, 3rd- and 5th-year

Strengths

There are a number of areas where UZCHS performed better than expected using the peer-review tool: early exposure to rural and under-served communities occurs from the 1st year onwards; CBE occurs in every year of study; practical experience is afforded to students during community-based activities (although the extent depends on their year of study, with more senior students having more 'hands-on' clinical experience); and a good relationship with health service personnel and the ministry of health.

The establishment of a Health Professions Education Department in 2014 was intended to encourage and facilitate the training of clinicians and other academics in educational approaches and skills.

CBE programmes, but the transfer of the programme to his office appears to have created a gap in the day-to-day academic oversight and co-ordination of the programme. Faculty and students report 'silo' learning or a lack of integration between disciplines, and perceive a disconnect between the objectives of the CBE programme and the overall MB ChB curriculum. Supervisors and clinical preceptors reported a poor understanding of the specific objectives of the CBE programme, particularly in the clinical years, as well as dissatisfaction with some of the infrastructure, support materials and resources available to implement the programme. Students reported inadequate supervision from medical professionals during community-based activities.

The various teaching departments reported that they do not have any overt teaching and learning outcomes for the CBE placement, and while there is some assessment of students' CBE experience in the form of reports and presentations and during the behavioural sciences course examinations in the 1st year, it is not rigorously assessed throughout the study years. Clinical skills proficiency was identified by preceptors as a major gap in students' capacity during field placements. Senior students reported that they were not adequately prepared to practise in rural areas, which lacked adequate nearby referral networks and required them to perform clinical skills they were not comfortable with. Despite their generally positive CBE experiences, most students reported that they have no intention of practising in rural or under-served areas when they qualify.

Key recommendations for UZCHS

The recommendations presented by the review team were generally well received and feasible, with some modifications (Table 3). The central recommendation was that UZCHS needed to strengthen the structures for curriculum review and academic co-ordination of the CBE programme and assign a person or group to the academic co-ordination of the programme. Other key recommendations included: (i) to convert the current 'field attachment' into a formal CBE programme, ensuring that there is a spiral of learning that links CBE activities from one year to the next with increasing levels of competency; (ii) to align learning objectives of the CBE programme with the overall medical curriculum, leveraging international guidelines, such as the Global Consensus on the Social Accountability of Medical Schools,^[6] the Lancet Commission Report,^[7] the World Health Organization's Transformation of Health Professions Education, 2013,^[8] and the approach of evidence-based medical education;^[9,10] (iii) to improve student supervision and set clear learning objectives and outcomes, thereby integrating knowledge across disciplines and ensuring skills proficiency; and (iv) to consider the introduction of family medicine to strengthen the provision of primary care, while postgraduate trainees in family medicine could potentially provide supervisory support to undergraduate students during CBE placements.

Other recommendations included reviewing the existing teaching sites to ensure they each provide appropriate learning opportunities, strengthening inter-professional learning through the CBE experience and improving the infrastructure (of accommodation and the health facilities), recognising that the latter will require political will and innovative income-generating strategies.

Post-review visit results

A 2-day meeting reviewing the recommendations with the dean, heads of department, and key faculty led to several main decisions and plans for improvement of the CBE programme (Table 4). One of the key decisions, taken in the absence of available funding for an academic co-ordinator, was to convene a working committee chaired by the head of the Health Professions Education Department to provide academic oversight of the

CBE programme. Remote support was provided to the institution by the review team to facilitate implementation of adopted recommendations.

Discussion

Peer review is not an accreditation process but rather focuses on providing health sciences schools with organising principles and an opportunity to reflect on the institutional standards and curriculum, which will help them become more accountable in addressing some of the health inequities and improvements to the health system.

The process of the review supported peer reviewers to learn from each other and share their experiences, similar to the in-country consortia of medical schools that formed within the MEPI network.^[11] Medical schools in the region share common constraints of limited resources and infrastructure^[12,13] and many face the challenge of finding funding for objective programme evaluations. The peer-review approach therefore affords a cost-effective mechanism to provide valuable feedback.

The post-visit support was a modification of the CHEER model and may well be a feature that others can incorporate in the future.

Common challenges shared with other MEPI schools

UZCHS has several challenges in common with other MEPI partners regarding the CBE programme, such as inadequate clinical preceptorship at CBE sites, increasing admission numbers and limitations of infrastructure and logistics, which include inadequate internet connectivity for online technology expansion, accommodation and transport.^[11] Other key areas needing attention relate to the CBE curriculum, appropriate course materials, textbook availability and alignment with the central curriculum. These challenges may undermine a major aim of CBE, which seeks to expose students to rural and under-served communities with the objective of encouraging future practice in these areas. Despite the positive sentiments expressed about the CBE experience, most students at UZCHS would not choose to practise in rural areas in future. This does not bode well for Zimbabwe, considering that the majority of the population (67%) live in rural areas and are dependent on government health services.^[14] This finding contradicts previous findings that the exposure to CBE in medical curricula increases the likelihood of graduates choosing to work in rural and under-served areas.^[15] Perhaps it is not just exposure to CBE (which in practice spans each year at UZCHS), but the quality and nature of that exposure which impacts positively on graduate choice. Studies have shown that three main factors influence choice of rural practice by medical graduates, i.e.: (i) rural origin; (ii) positive clinical and educational experience in rural placements during undergraduate medical training; and (iii) targeted postgraduate training for rural practice.^[16,17] There is no explicit student recruitment and selection policy aimed at students from rural origin at UZCHS, with the majority reporting being of urban origin, and no postgraduate rural training is offered. Therefore, all three factors may be linked to graduate choices at UZCHS.

Key lessons

While the on-site review occurs within a relatively short space of time (3 - 5 days), the entire process takes several months.^[18] Hosts and reviewers must therefore be committed to participation throughout the entire process. Buy-in from key stakeholders is important to gather meaningful information and to implement recommendations.

The purpose of evaluation is to identify whether a programme meets its objectives. Without clearly articulated programme goals, evaluation is challenging.

A specific area of focus for the review is important, as there is a danger of covering too much (depth v. breadth).

External peers can offer safe, empowering and multifaceted support to improve and evolve educational programmes within institutions, while enjoying a mutual learning experience. Peer review is a fluid process and the approach is one of a conversation with supportive peers, with openness to adaptation. The protocol should, therefore, not be rigidly adhered to if it is not effective in a particular context. In this instance, the addition of the 12th criterion to the evaluation framework was deemed an important adaptation for the UZCHS context, and probably also for other CBE programmes.

Study limitations

Data collection of pre-review-supporting documentation and completion of course curriculum spreadsheets was unsuccessful owing to the very poor response from faculty. This led to interviews being focused mainly on gathering general information without adequate time for in-depth probing.

Daily debriefing sessions of the reviewer team with the host institution's academic representatives would have been very helpful in clarifying issues as they arose. Incorporating such meetings into the daily schedule would be best.

Only two community-based sites were selected because of their proximity to the university. Thus, the reviewers relied on the two preceptors to relate their experiences and perceptions rather than gaining first-hand information and observations beyond the two sites visited.

Conclusion

This evaluation demonstrated the value of a peer-review process to offer a multidimensional, external but friendly assessment of a CBE programme. The process provided valuable insight and triggered institutional commitment and motivation to revise and align the curriculum with the intended goals. Regular evaluation of CBE activities is critical to ensure that educational goals are being met and that limited resources for medical education are being used effectively to train a relevant workforce.

Acknowledgements. We wish to acknowledge Ms Rebecca Bailey and the CapacityPlus team at IntraHealth International, who supported the planning and co-ordination of the peer-review visit and were part of the initial conceptualisation of the project. We thank the staff, students and clinical preceptors of the University of Zimbabwe for their participation in the peer-review process.

Author contributions. DM: co-facilitated the peer-review project, contributed to the analysis, conducted the write-up of the project results and wrote the manuscript. IC: facilitated the peer-review project, was involved in the concept and design of the process, contributed to the data analysis and made substantial critical revisions to all drafts of the manuscript. MSM: peer reviewed the project, contributed to the data analysis and made critical revisions of the manuscript. JGH: principal investigator on the UZCHS MEPI project, and involved in the

conception and design of the process, as well as critical evaluation of the draft manuscript. ZT: member of the project management team and made substantial contributions to the interpretation of the data, as well as editorial revision of the manuscript. MHM: peer reviewed the project, and contributed to the data analysis and critical evaluation of the draft manuscript. MMC: principal investigator of the project, involved in its conception and design, as well as in critical evaluation of the draft manuscript. AM: on-site project co-ordinator and responsible for pre-visit data collection, as well as contributing to the review of the manuscript. MS: peer reviewed the project, and contributed to the data analysis and critical evaluation of the manuscript. All authors approved the final submitted version of the article.

Funding. Funding was received from the CapacityPlus project within IntraHealth International.
