**ABSTRACT**

We present the first mitochondrial genome of a South African endemic catshark, *Poroderma pantherinum*. The complete mitogenome is 16,686 bp in length, comprising 13 protein-coding genes, 2 rRNA genes, 22 tRNA genes, and one non-coding control region. Similar to other shark mitogenomes, it is AT rich (61.1%), with a GC content of 38.9%. Protein-coding genes used one of two start codons (ATG and GTG) and one stop codon (TAA/TA-/-T-). Phylogenetic analysis of the leopard catshark and 34 carcharhinid species showed that it clusters with two other scyliorhinid species (*Cephaloscyllium umbratile* and *Scyliorhinus canicula*) with 100% support.

The leopard catshark *Poroderma pantherinum* (Carcharhiniformes: Scyliorhinidae) is a bottom-dwelling South African endemic shark, predominantly distributed in inshore waters along the south and south-east coasts (Human 2006). There is a lack of data on the population trends of *P. pantherinum* and it is currently assessed as Data Deficient using the International Union for the Conservation of Nature (IUCN) Red List Criteria (Human 2009). Southern Africa is a biodiversity hotspot with many endemic catsharks (Ebert and van Hees 2015); however, the lack of genetic resources for South African sharks delays the understanding of species delineation, population genetics, and reproductive behaviour (Bester-van der Merwe and Gledhill 2015). Here, we present the first complete mitogenome sequence and phylogenetic position of a South African endemic catshark.

A tissue sample (fin clip) was taken from one female *P. pantherinum* individual in Walker Bay, Hermanus, South Africa (geospatial coordinates: −34.421111, 19.244010) in 2016. The fin clip sample (FWB387) is stored in 100% ethanol at Stellenbosch University, Department of Genetics. Total genomic DNA was isolated using a standard cetyltrimethylammonium bromide (CTAB) extraction protocol (Sambrook and Russell 2001). Low coverage whole genome sequencing was performed on an Ion Torrent S5™ platform (Thermo Fisher Scientific, Waltham, MA, USA). Libraries with a mean insert size of 600 bp were prepared for sequencing using the Ion Plus Fragment Library Kit (Thermo Fisher Scientific), following the manufacturer’s protocol. The generated sequence reads were quality filtered using Torrent Suite™ Software (Thermo Fisher Scientific) and mapped to a reference mitogenome from *Scyliorhinus canicula* (NC_001950.1) in Geneious® v.10.2.3 (Kearse et al. 2012). The final assembly was annotated using MitoAnnotator (Iwasaki et al. 2013). A MUSCLE alignment, excluding ND6 and the control region, was performed in Geneious with 36 publicly available elasmobranch mitogenomes. A Bayesian tree (Figure 1) was generated in MrBayes v.3.2.6 (Huelsenbeck and Ronquist 2001) using the best substitution model (GTR + I + G) determined by the Bayesian Information Criterion in jModelTest2 v.0.1.10 (Darriba et al. 2012). The Bayesian analysis was run for 1,000,000 generations, sampled every 1000 generations and the first 25% of trees were omitted as burn-in with the remaining trees used to calculate the posterior probabilities.

The complete mitogenome of the leopard catshark (accession MH321446) is 16,686 bp in length, containing 13 protein-coding, 22 tRNA, 2 rRNA genes, and one non-coding control region. The nucleotide base composition is rich in A (30.1%) + T (30.1%) and low in C (25.0%) + G (13.9%), which is common for elasmobranch mitogenomes (Ruck et al. 2017). All genes started with the standard ATG codon, except COI, which started with the alternate GTG codon. Majority of the genes ended with the TAA stop codon, with ND2, COII, ND3, ND4, and CYTB ending with an incomplete stop codon (TA–/T–). The Bayesian tree (Figure 1) shows that *P. pantherinum* clusters with two other catshark species (*Cephaloscyllium umbratile* and *Scyliorhinus canicula*) with 100% support, whereas *Haloedurus buergeri* clusters with the remaining five families supporting earlier work by Chen et al. (2016) that the family Scyliorhinidae is paraphyletic.
Acknowledgements

The authors thank the South African Shark Conservancy (SASC) for providing the tissue sample. Sequence data were generated at the Central Analytical Facility, Stellenbosch University, the authors thank all staff who assisted in the sequencing of this sample.
